GLAST LAT detection of a possible new gamma-ray flaring blazar: PKS 1502+106

ATel #1650: [S. Ciprini \(Univ./INFN Perugia\) on behalf of the GLAST Large Area Telescope Collaboration](#)
on 8 Aug 2008; 00:02 UT
Credential Certification: Stefano Ciprini (stefano.ciprini@pg.infn.it)

Subjects: Gamma Ray, >GeV, AGN, Quasar

Referred to by ATel #: [1661](#), [1905](#)

The Large Area Telescope (LAT), one of two instruments on the Gamma-ray Large Area Space Telescope (GLAST) (launched June 11, 2008), which is still in its post-launch commissioning and checkout phase, has been monitoring high flux from a source positionally consistent with the blazar PKS 1502+106 (R.A.:15h04m24.9797s; Dec.:+10d29m39.198s, also known as OR 103 and S3 1502+10) since August 6, 2008.

Preliminary analysis indicates that the source is in a high state with a gamma-ray flux ($\geq 100\text{MeV}$) well above pre-defined LAT flaring source reporting threshold of $2 \times 10^{-6} \text{ photons cm}^{-2} \text{s}^{-1}$.

This is a well-known radio source classified as a Flat Spectrum Radio Quasar (FSRQ), observed by several X-ray instruments. This is the first time that it has been reported to have gamma-ray emission.

Please note that PKS 1502+106 has two possible redshifts listed in the literature: $z=0.56$ and 1.83 ; the former seems preferred (A.E. Wright et al. 1979 ApJ 229,73; B.J. Wilkes 1986, MNRAS, 218, 331).

Because GLAST has just started its scientific standard operations, regular gamma-ray monitoring of this source will be pursued. In consideration of the ongoing activity of this source we strongly encourage multiwavelength observations of PKS 1502+106.

The GLAST LAT is a pair conversion telescope designed to cover the energy band from 20 MeV to greater than 300 GeV. It is the product of an international collaboration between NASA and DOE in the U.S. and many scientific institutions across France, Italy, Japan and Sweden.

Fermi monitored source list light curve

The screenshot shows the Fermi Science Support Center website. The main header features the Fermi logo and the text "Fermi Science Support Center". Below the header, there is a navigation bar with links to Home, Observations, Data, Proposals, Library, HEASARC, Help, and Site Map. The "Data" menu is expanded, showing sub-links for Data Policy, Data Access (including LAT Data, LAT Catalog, LAT Data Queries, LAT Query Results, LAT Weekly Files, and GBM Data), Data Analysis, Caveats, Newsletters, and FAQ.

The main content area is titled "Monitored Source List Light Curves". It contains a brief description of the LAT team's monitoring of bright sources and transient sources, mentioning the flux threshold of $1 \times 10^{-6} \text{ cm}^{-2} \text{s}^{-1}$. It also includes a note about the PLEASE NOTE section, which provides details on how fluxes are derived and updated.

Below this, there is a note about software errors and flux upper limits. A detailed description of the data included in these files is provided, along with a link to more information.

The page displays two sets of light curves for sources 4C 31.03 and 0208-512. For each source, there are four panels: Daily LC (top-left), Daily LC Fits File (top-right), Weekly LC (bottom-left), and Weekly LC Fits File (bottom-right). Each panel shows a scatter plot of flux density versus time, with red dots representing individual data points and a black line representing the fitted curve.

Weekly Fermi sky blog

The screenshot shows the Fermi Gamma-Ray Sky blog page. The header is "FERMI GAMMA-RAY SKY". Below the header, the date "WEDNESDAY, SEPTEMBER 12, 2012" is displayed. The main title is "Fermi LAT weekly report N.221".

Below the title, it says "Covered period: 2012.Aug.27 - 2012.Sep.02" and "LAT Mission week: 221.57 - 222.57".

The main content area lists several detected sources:

- Mkn 421 and B3 1343+451 were detected almost all week long with flux in the range $0.4\text{--}0.7 \times 10^{-6}$ and $0.5\text{--}1.0 \times 10^{-6}$, respectively.
- Four other sources were detected at least in 3 days of the week with some trend in brightness. The flux decreased from 2.1 to 0.5×10^{-6} for PKS 1510-08 and from 0.9 to 0.5×10^{-6} for PKS 2233-148. On the contrary, the flux increased from 0.4 to 0.7×10^{-6} for 4C +38.41 and from 0.6 to 0.9×10^{-6} for PKS B1424-418.
- Sporadic activity (fluxes above 1.0×10^{-6}) was observed from S4 0218+35 (1.7 on Aug. 27) and 3C 273 (1.9 on Aug. 31).
- Sporadic activity (fluxes below 1.0×10^{-6}) was observed from BL Lacertae (0.5 and 0.8 on Aug. 27 and 28), PKS 2326-502 (0.4 and 0.7 on Aug. 28 and 30), PKS 0250-225 (0.4 on Aug. 30), PKS 0405-385 (0.4 on Aug. 31), PKS 0537-441 (0.2 on Sep. 02), B2 0716+33 (0.3 on Sep. 01), and 1H 1013+498 (0.1 on Sep. 01).

On the right side, there is a sidebar with links to LAT DATA, LAT First Catalog, LAT Monitored Source List Light Curves, LAT Bright Source List, and a link to the "data" interface. There is also a section for BLOG ARCHIVE with links to posts from 2012, September, August, July, June, May, April, and March.

Subjects: Gamma Ray, >GeV, Nova, Transient

Referred to by ATel #: [4287](#), [4288](#), [4310](#)

The Large Area Telescope (LAT), on board the Fermi Gamma-ray Space Telescope, has detected a transient gamma-ray source in the Galactic Bulge: Fermi J1750-3243. Preliminary analysis of the Fermi-LAT data indicates that from 2012 June 18-24, the source was detected with a >100 MeV flux of $(0.8 \pm 0.1) \times 10^{-6}$ ph cm $^{-2}$ s $^{-1}$ (statistical only; a systematic uncertainty of 30% should be added to this number) with >10 sigma significance. The source was detected with >3 sigma significance on a daily basis as early as June 16 and up to June 30. There is no previously reported gamma-ray source at this location.

Possible Association of the Gamma-ray Transient Fermi J0639+0548 with Nova Mon 2012

ATel #4310; [C. C. Cheung \(NRC/NRL\), S. N. Shore \(U. Pisa and INFN\), I. De Gennaro Aquino \(U. Pisa\), S. Charbonnel \(Durial Observatory, France\), J. Edlin \(Idaho Falls, Idaho\), E. Hays \(NASA/GSFC\), R. H.D. Corbet \(UMBC, NASA/GSFC\), D. L. Wood \(NRL\); on behalf of the Fermi Large Area Telescope Collaboration](#)

on 17 Aug 2012; 18:30 UT

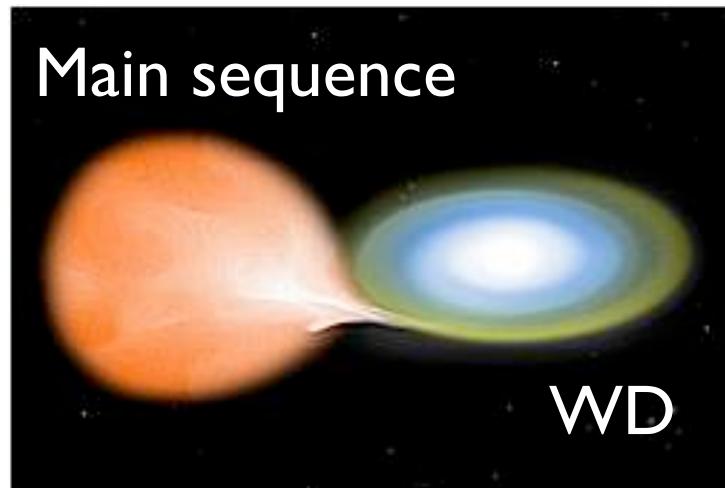

Credential Certification: Teddy Cheung (ccheung@milkyway.gsfc.nasa.gov)

Subjects: Gamma Ray, >GeV, Nova, Transient

Referred to by ATel #: [4320](#), [4321](#), [4352](#), [4365](#), [4376](#)

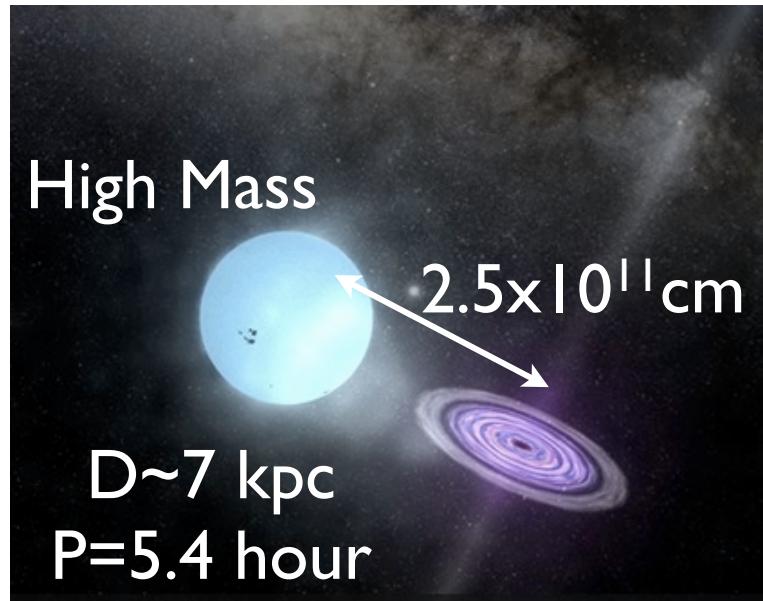

In ATEL #4224, we reported the detection by the Fermi Large Area Telescope of Fermi J0639+0548, a new gamma-ray transient in the Galactic plane, beginning on 2012 June 22. The transient was seen through the Monoceros region of our Galaxy with Galactic coordinates, $(l, b) = (206.42 \text{ deg}, 0.03 \text{ deg})$. We noted the gamma-ray source was close to the Sun at the time of detection, thus precluding prompt follow-up with Swift (and also ground-based optical observers).

Classical Nova

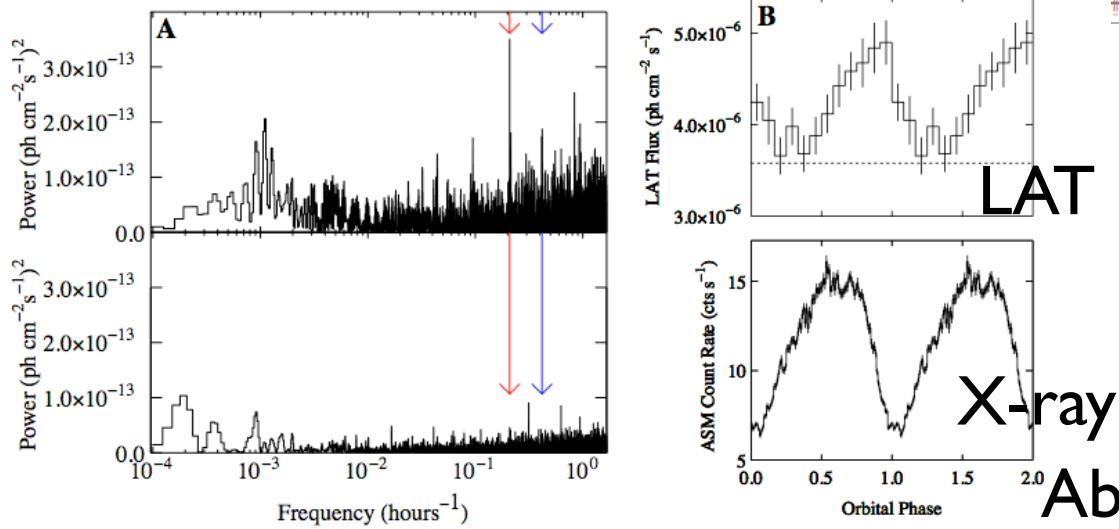

- Event rate is $\sim 10/\text{yr}$ for classical nova
- Why only these 2 events are detected by LAT?

Transient modulated gamma-rays from Cygnus X-3

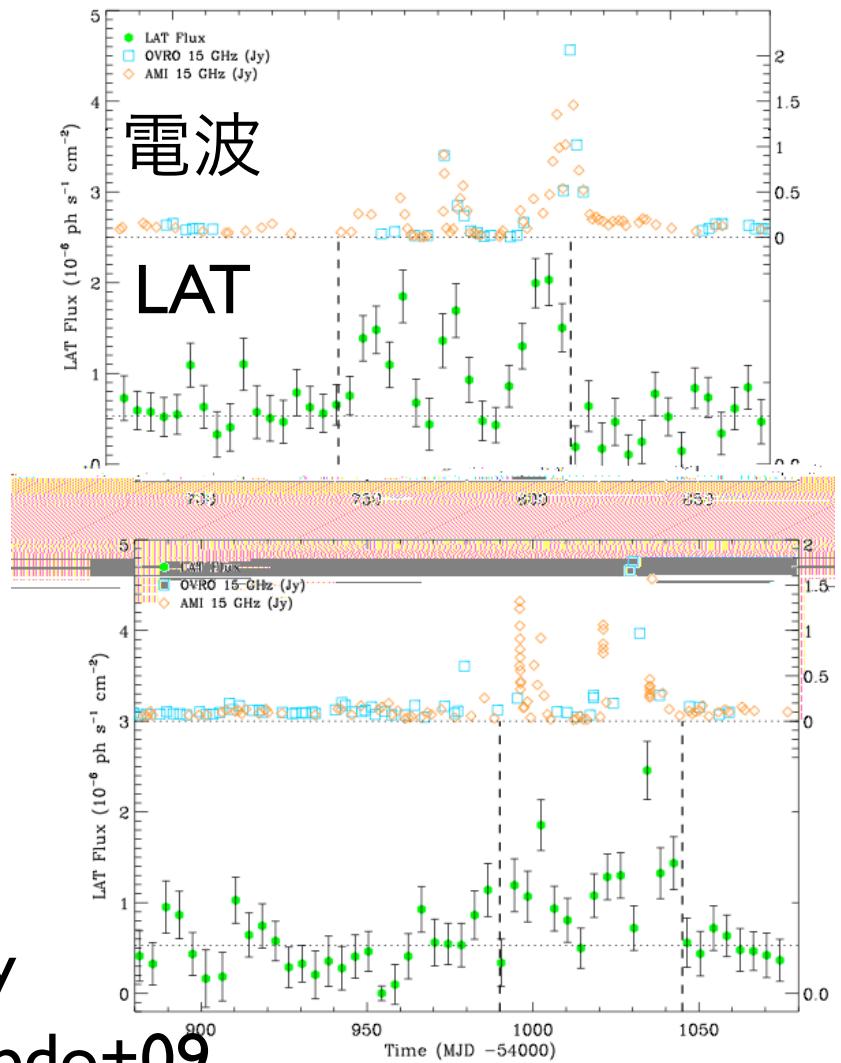

Clear modulation

MAGIC detects very high energy gamma-ray emission from the FSRQ PKS 1510-089

ATel #3965; [Juan Cortina \(IFAE Barcelona\) on behalf of the MAGIC Collaboration](#)
on 13 Mar 2012; 20:19 UT

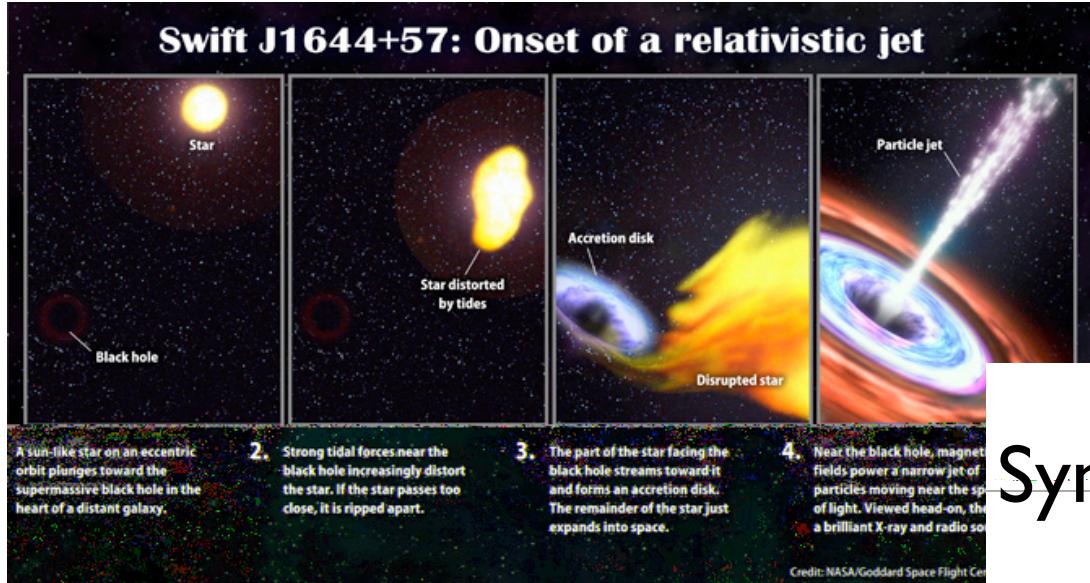

Credential Certification: Juan Cortina (cortina@ifae.es)

Subjects: Gamma Ray, >GeV, TeV, VHE, AGN, Quasar

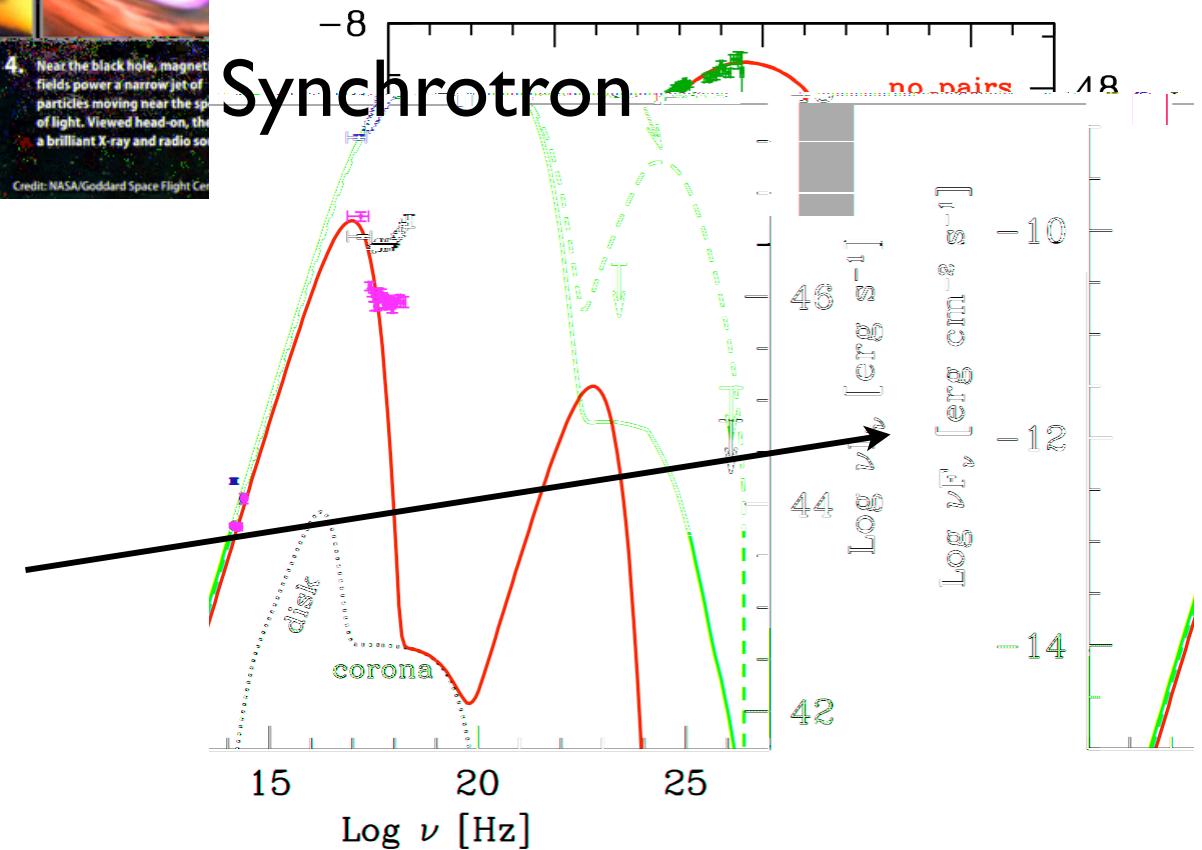

Following the communication from the Fermi-LAT collaboration on February 1st that PKS 1510-089 ($z=0.36$, R.A.=15h 12m 50.5s, Dec.=-09d 05m 59.8s, J2000) underwent spectral hardening in MeV-GeV range (Dave Thompson, priv. comm. to TeV facilities) and ATel #3907 announcing enhanced gamma-ray emission observed by AGILE on February 2nd, the source was observed by MAGIC starting on February 3rd, just before the full moon shut down. The observations were resumed on February 19th and in total ~10 hours of data have been collected. The preliminary analysis of the data reveals a clear signal with a statistical significance of >5 sigma.

- LAT and MAGIC spectra are smoothly connected with broken power-law of $\Gamma_{\text{low}} \sim 2.2$, $\Gamma_{\text{high}} \sim 2.7$, and $E_{\text{break}} \sim 1$ GeV (Yesterday's Saito-san's talk)
- Emission region is outside BLR

LAT non-detection of Tidal disruption event

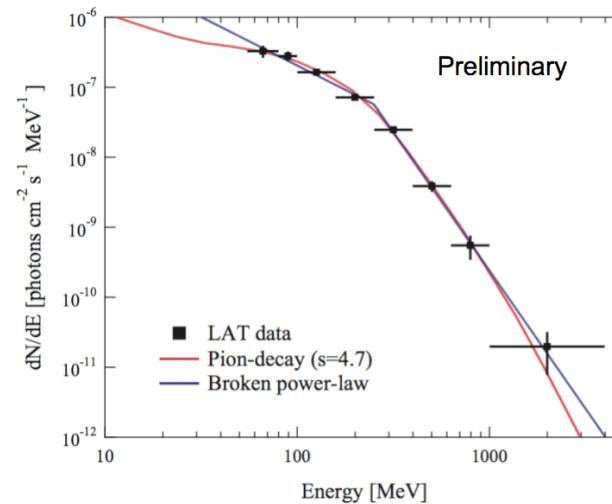

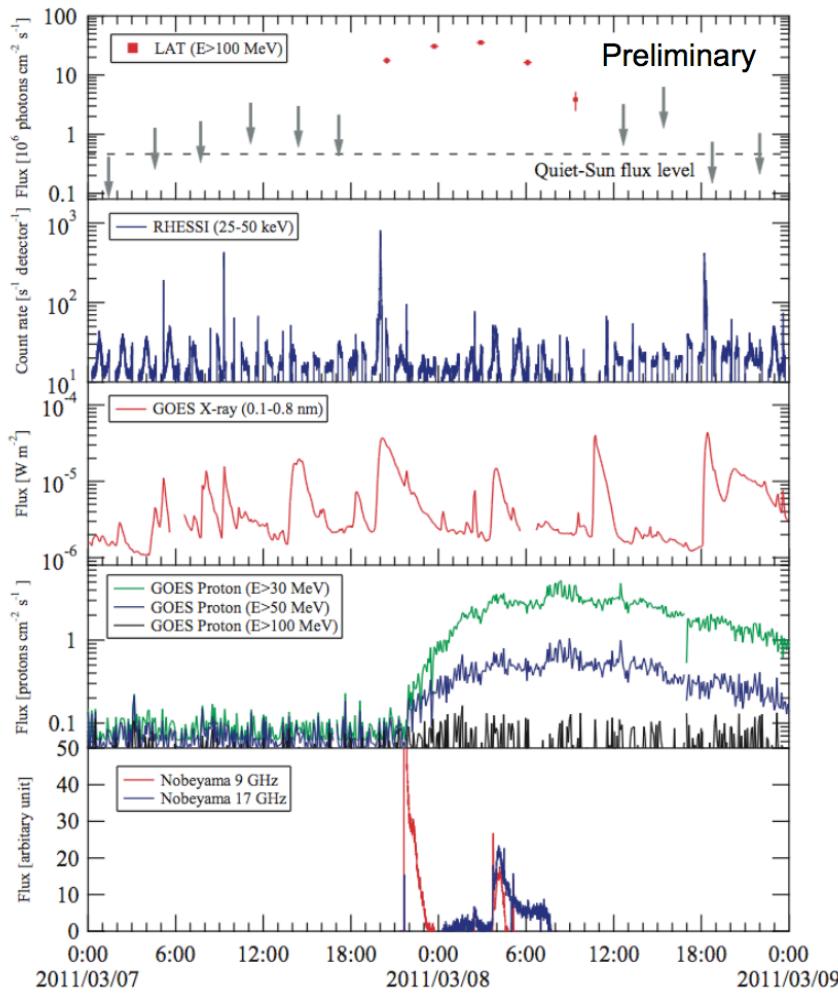

SSC component is suppressed by γ - γ pair production
